3567. PAVLOVSKY E.N., NIZOVKIN V.K., PERVOMAYSKI G.S., BUCHMAN L.B.
and GLAGOLEVA V.A. Moscow. "New composition of repellent
ointment (Russian text) VO.-MED. Z. 1956. 7 (46-49)
For the protection of humans from massive attacks and bites of winged blood suck-
ers, the authors prepared and found effective several specimens of the phthalate
ointments. The most promising was ointment of the following composition: di-
methylphthalate 74-77%, ethyl-cellulose 9-10%, kaolin 14-16%, terpensol 0.1%. This
gives complete protection in the first three hr.; in the following 2 hr. occasional
bites may occur. After 6 hr. the ointment loses much of its repellent properties and
should be reapplied to the skin. Its use is advised also for people working during
the night or compelled to spend the night in the open in mosquito-infested localities.
The duration of the protection afforded by the ointment after a single application
depends on the quantity used and on careful rubbing into the exposed parts of the
body. For a single application to the face, neck and the hands about 2 g. of the
ointment are required, which should be rubbed into the skin with clean fingers.
Repeated use of the ointment did not produce irritation of healthy skin.

Abstract : After mites have fed upon the hair which
grows on the sheared section of the back of a
rabbit, the new hair of it changes to a
different color and density. Two experimental
females gave birth to one rabbit each, in whom
a "rectangular section with shorter hair on the

back was especially clearly marked, which
exactly corresponded to the contours of the
surface where mites had fed on the back of
the mother". They had no offspring. In one
of the young rabbits of the experimental
female a "rectangular section with shorter and
dark-colored hair could be distinguished", and
three of her other rabbits had different
sections of hair on their backs. The females
of the first generation "which inherited the
changed skin cover were inbred with analogous
males". In the offspring of the second
generation "sections on the back were covered
with hair which was much thicker and of a
darker color than on the adjacent sections
of the skin. The location of these sections

Geograficheskoye obshchestvo SSSR

Antarktika; materialy po istorii issledovaniya i po fizicheskoy geografii. (The Antarctic; Materials on the History of its Exploration and Physical Geography) Moscow, Geografgiz, 1958. 445 p. 5,000 copies printed.

Resp. Eds.: Pavlovskiy, Ye. N., Academician; Kalesnik, S. V., Corresponding Member of the USSR Academy of Sciences; Ed.: Grishina, L. I.; Tech. Ed.: Gleykh, D. A.; Map Ed.: Kiseleva, Z. A.

PURPOSE: The book, written in a semi-popular style, is intended for the large circle of geographers interested in the Antarctic region.

Card 1/8

The Antarctic; Materials on the History (Cont.)

464

COVERAGE: The present volume, sponsored by the Geographical Society of the USSR, is a collection of articles authored by several geographers summarizing up to date information on the Antarctic region. It provides an account of exploration and discovery since the first Russian expedition into the Antarctic in 1819, and describes the region's geological and geomorphological structure, glaciation processes, and the water currents of the south polar seas. The last chapter contains a glossary of Antarctic place names which is appearing in Soviet literature for the first time. The book is profusely illustrated with diagrams, photographs, and maps.

The Antarctic; Materials on the History (Cont.)	464
Shvede, Ye. Ye. Discovery of Antarctica by Russian Navigators in 1819-1821	
Introduction	5
Preparation for the expedition	5
General plan of the expedition	6
Scientific results of the first Russian Antarctic expedition	30
	43

An account is given of the first Russian Antarctic expedition and the discovery of the Antarctic Continent by Bellinsgauzen and Lazarev. Personnel, equipment, preparations for the trip, the plan of the expedition, navigation in the Antarctic waters and discoveries are described in detail. The hydrographic, cartographic, oceanographic, climatological and physical geographic observations carried on by the expedition are commented on in brief.

Card 6/8

The Antarctic; Materials on the History (Cont.) 464

The Antarctic region is delimited by the northern boundary of the antarctic waters, i.e. where the antarctic waters meet those of the moderate latitudes. The author describes the relief of the ocean floor, the three types of water masses, currents, tides, sea ice, icebergs, and the extent of the ice covering in the Antarctic.

ABSTRACT: Soviet scientists were invited to participate in the 15th International Zoological Congress in London. Academician Ye. N. Pavlovskiy reported on new studies of Soviet parasitologists ~~and Professor~~ A.V. Ivanov reported his discovery of a new type of animal (the "pogonofor") which is to be found in the deeps of oceans.

Zoological Congress imeni Ch. Darwin and A. Wallace (Zoologicheskiy kongress im. Ch. Darvina i A. Uolesa)

PERIODICAL:

Vestnik Akademii nauk SSSR, 1959, Nr 1, pp 94 - 97 (USSR)

ABSTRACT:

The 15th Congress took place in London on July 16-23, 1950. It was combined with the 100th anniversary of the day of the first publications on the theory and factors of evolution. 1740 persons took part, including a large delegation of Soviet zoologists led by the author of this article. Ye. N. Pavlovskiy (USSR) was distinguished as a pioneer of the theory of evolution by the silver medal of Darwin and Uolles. The work of the Congress was carried out by 12 committees. Moreover, on the first day the author describes the work of these committees. The Soviet scientists submitted 55 reports, 28 of which were read at meetings. G. Ya. Bey-Bienko reported on the initial divergence of species, K. V. Arnol'di on the interrupted propagation of species population, A. G. Sharov on evolution as a process of ontogenesis, B. L. Astaurov on the origin and evolution of

Card 1/3

Zoological Congress imeni Ch. Darwin and A. Wallace

triploid parthenogenesis of the silkworm. Ye. N. Pavlovskiy reported on some ways of evolution of infectious and parasitic diseases. The Soviet delegation exhibited the work of the Soviet research ship "Vityaz'" in the Pacific Ocean, as well as editions of the book "Fauna of the USSR" and other publications of the Zoologicheskiy institut Akademii nauk SSSR (Zoological Institute, Academy of Sciences USSR). At the end of the Congress, the exhibits were presented to the British Museum of Natural History. Some members of the Soviet delegation visited this Museum and exchanged collection material. The Soviet zoologists took part in the meetings of the commissions of the Congress, as well as in the meetings of the editorial staff of the periodical "Embriologiya i eksperimental'naya morfologiya" (Embryology and Experimental Morphology). Some excursions were also made. The author considered these interesting, as they enabled new research methods to become known. Especially noted were the workshops of institutions, which make different devices according to the designs of researchers. Before their departure, the Soviet delegation organized a reception at the Soviet Embassy for a great number of Congress members, where a film on the Antarctic regions in English language was pro-

(SOV/25-59-5-22/56

AUTHOR: Pavlovskiy, Ye. N., Academician, Lt. General of the Medical Corps

TITLE: Conquerable Infections.

PERIODICAL: Nauka i zhizn', 1959, No. 5, pp 33-36, (USSR)

ABSTRACT: The author is the veteran Soviet zoologist and parasitologist, an Active Member of the AS USSR and of the Academy of Medicine and President of the Geographical Society of the JSSR. In 1948 he published a "Handbook on Parasitology of Man and the Science of Contagious Diseases". His article refers to the ravages created by infectious and parasitical diseases among the populations of the middle ages and modern times. In 1909 there were over 126,000 cases of smallpox in Russia, but since the Soviets came to power, smallpox, cholera, recurrent fever and dysentery have been exterminated. More recently, malaria, which at one time was widespread, has been considerably reduced. Infantile mortality has been cut in half. One of the problems of combating infectious diseases is the location of hot beds of carriers (ticks, etc) of bac-

Card 1/2

SOV/25-59-5-22/56

Conquerable Infections

teria, viruses, spirochaeta, rickettsia, helminths, etc. After an outburst of epidemics, these carriers usually (but only temporarily) disappear. The bacteria, etc., like all living beings, need suitable media to breed, whether on land in the water or in the bodies of other larger beings. In the latter case all their vitality is directed on reproduction, which is sometimes phenomenal. An ascarid annually produces 50 million eggs. In Siberia, a carrier (*Ixodes persulcatus*) was found to carry encephalitis. Some rodents in Central Asia are carriers of skin diseases. Some carriers (ticks) live 20 - 25 years and can exist without food for many years. In conclusion, the author describes preventive measures applied in the USSR. There are 2 photographs and 3 drawings. Akademiya meditsinskikh nauk, SSSR (USSR Academy of Medical Sciences)

AUTHOR:

Pavlovskiy. Ye.N., Academician

SOV/26-59-1-16/34

TITLE:

For a Many-Sided Solution of Biological Problems (Za
~~kompleksnoye~~ razresheniye biologicheskikh problem)

PERIODICAL:

Priroda, 1959, ^Nr 1, 38-40 (USSR)
⁴⁸

ABSTRACT:

The author traces the living agents causing diseases, disability and eventual death, back to the early stages of life on earth. He concludes that such agents as bacteria, parasites and viruses have accompanied animals and man from the very beginning of their existence. He also describes a few instances of harmless and useful symbioses. Together with co-researchers and other scientists, the author studied the natural nidi of infectious diseases on numerous expeditions in the USSR and abroad. He succeeded in establishing such natural nidi for over 15 serious diseases, among them the seasonal encephalitides, tick-caused diseases, yellow fever, rabies, leishmanioses, tularemia, plague, trichinoses, etc. The proper knowledge of such nidi of diseases becomes especially important when new areas are opened to settlement as was the case with the virgin lands and as will be the case with the new industrial settlement

For a Many-Sided Solution of Biological Problems

areas in the east of the USSR. This knowledge has also met with favorable acclaim and application in the CSR, Poland, Yugoslavia and Red China. The materialization of the author's system will depend greatly on the speed with which newly discovered nidi of diseases are reported to the Ministerstvo zdravookhraneniya SSSR (Ministry of Health of the USSR), and the related organizations of the other Soviet republics and the ensuing measures. There is 1 photo.

TITLE: Laboratory Observations on Ornithodoros Hermsi Wheeler, 1935

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 4, pp 863-864
(USSR)

ABSTRACT: The species mentioned in the title is known to occur only in the USA. It lives there in the Western States (Refs 1, 4, 5) in altitudes between 1500 and 3300 m above sea level. In all its stages of metamorphosis it is able to transmit spirochaeta of a special species (Table 2). The three male and eight female animals that arrived in the authors' laboratory in February 1947, soon started reproduction. Within 11 years 4 generations developed. They lived on Guinea-pigs and mice. They sucked during every season and generally were full within 30-40 minutes (grown-up animals sometimes within 1.5-2 hours). Some of the O. hermsi bred 10 years ago, are alive and still go on reproducing. Such a long life hitherto has not been known. The time of starvation for grown-ups also proved longer than 7 months (according to Ref 3). Unfed larvae died after 3-4 months, nymphs of the first stage died at 26° after 5-7 months and at 15-18° after almost one

Laboratory Observations on *Ornithodoros hermsi* Wheeler, 1935

year. Nymphs of the third stage and grown-ups survived a starvation period of 3 years. Hungry females and those which never in their lives have been fed, are still capable of producing descendants fit for life. A dependence of reproduction on the season could not be observed. Contrary to American publications 2 stages of larvae with 6 legs were not observed. Table 1 shows the period between feeding and skinning. A comparison is given with other *Ornithodoros* species observed in the laboratory with regard to their development. At 26° the development of *O. hermsi* takes 56-93 days from the beginning of oviposition to the development of imagoes from nymphs of the second stage, and 73-156 days in the third nymph stage, 156-258 days in case of a fourth nymph stage. At room temperature the nymph stage may last for 7 years when the feeding intervals are long. Spirochaeta of 5 other species of ticks are not transmitted by *O. hermsi*. There are 2 tables and 5 references.
